PROJECTS PORFOLIO

The portfolio is included individual projects which have been done in free time as a freelancer, researching interesting topics or trying new technology.

Author: Tinh Van

Singapore, 2021

Contains

1. Virtual-fence for safety measurement
2. Person detection/counting
3. Vehicle tracking
4. ORC and color classification
5. Shrimp box counting system
6. Bottle cap detection and orientation analysis
7. Steel defect detection and segmentation
8. Coin classification

1. Virtual-fence for safety measurement

RTSP/USB camera

About

- A virtual fence that will alarm if the operator uses hand during the machine is running.
- Project was deployed on Jetson Xavier AGX

Jetson Nano/Xavier

Hand detection and alarm if cross virtual fence
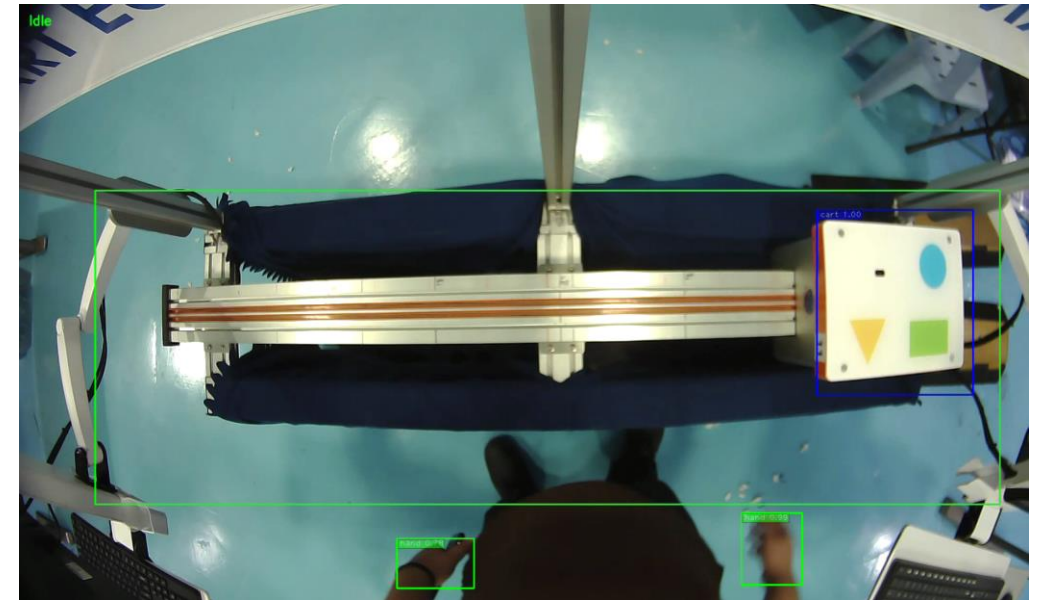

TCPIP

TCPIP to PLC to alarm

I/O

Trigger I/O pin to control hardware
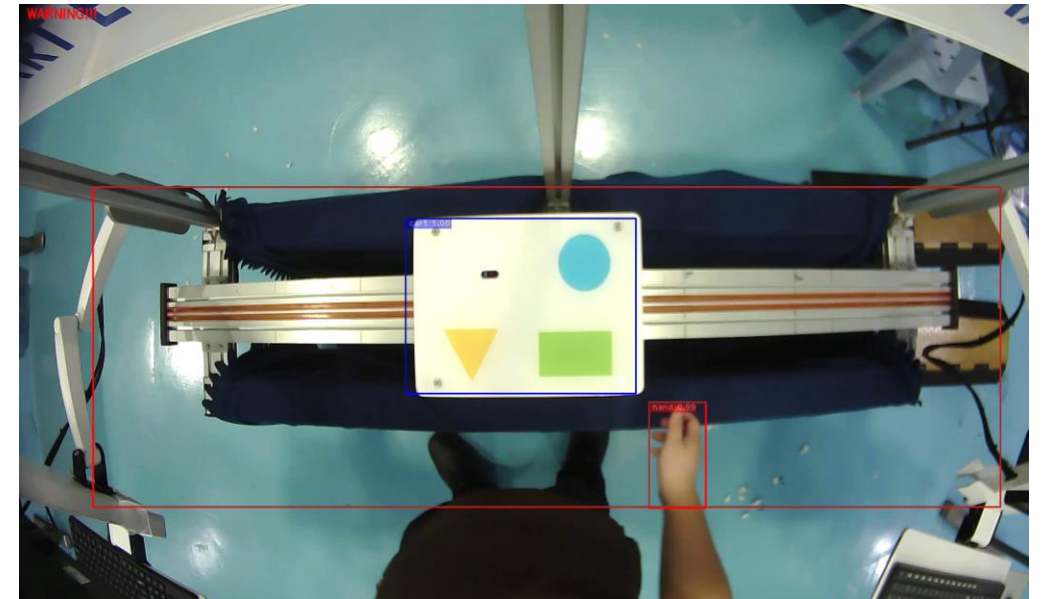

# 1. Virtual Fence for safety measurement

Idle status

No hand cross virtual fence

Warning status

Hand(s) cross virtual fence

2.1 Person Detection/Counting (ver. Jetson)

Web database

Store detect and counting result

CCTV

CCTV stream over network

Stream (RTSP)

NVIDIA Jetson Nano

Running object detection to detect people in video

Website

Show result in real-time

2.2 Person Detection/Counting (ver. AWS)
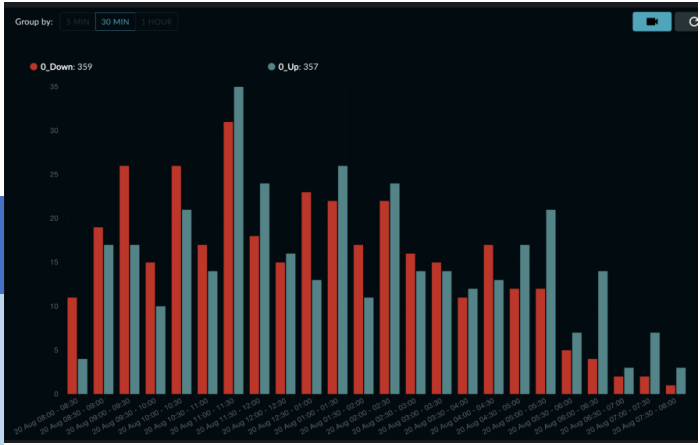

CCTV
CCTV stream over network

Amazon cloud
Run object detection model which stream from multiple CCTVs
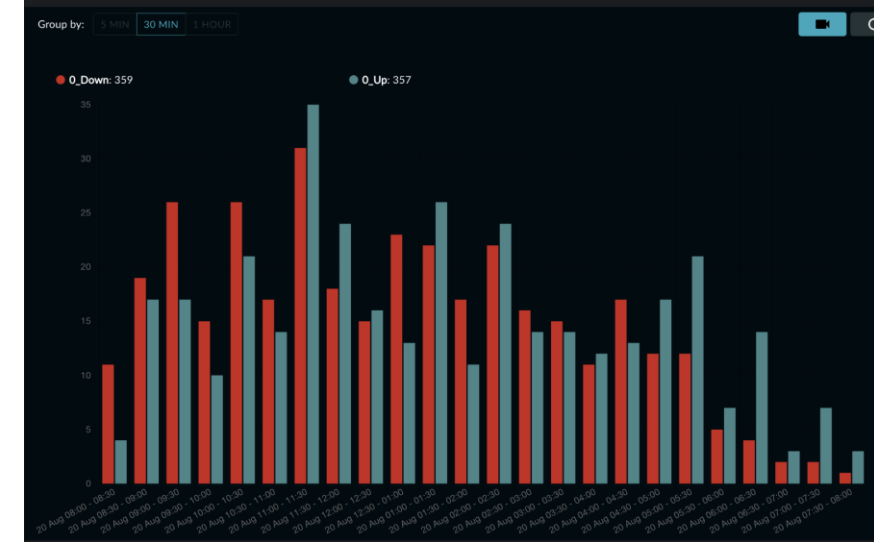

Website
Show result in real-time

2.2 Person Tracking

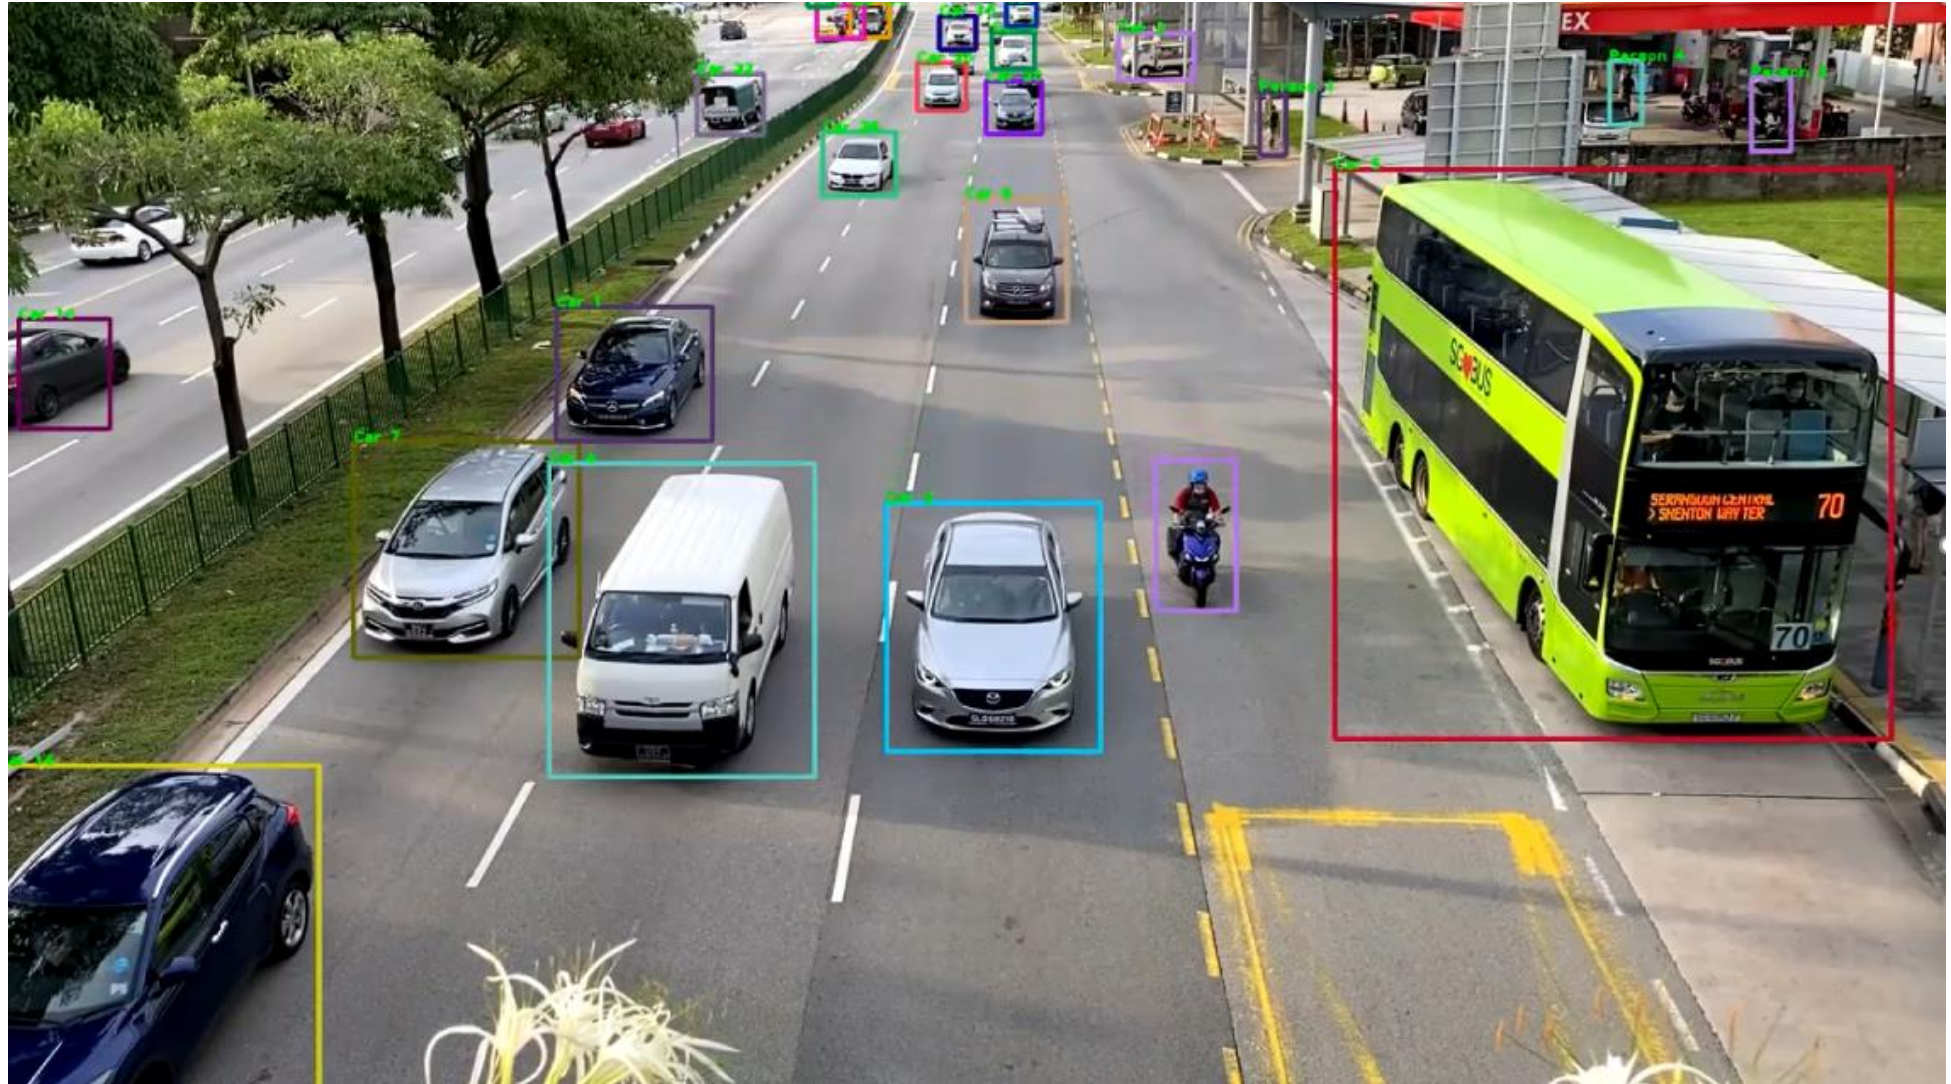

Pedestrian tracking

From person detection, using algorithm to track pedestrian

3. Vehicle Tracking

Vehicle tracking

Another application using object detection, detect vehicle, counting and tracking

4. OCR and Color Classification

About

- Detect the number area
- Color of number and background
- ORC to get the number value
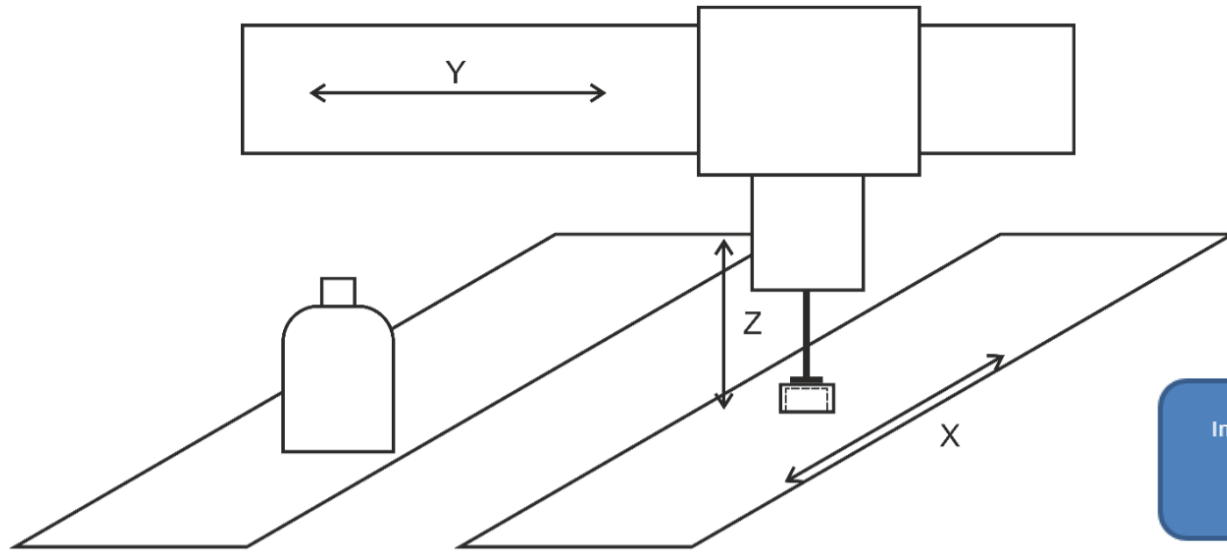

5. Shrimp Box Counting System

Box counting

Using object detection to detect and count box of shrimp.
- Video stream from RTSP camera
- UI is developed by PyQt5
- Applied in production

| DISCONNECT | Small Buckets 1: 14 | Small Buckets 2: 0 | Total: 17 |
	Large Buckets 1: 0	Large Buckets 2: 3	
☑ Visualize	Empty Buckets 1: 0	Empty Buckets 2: 0	
	Camera IP 172.25.70.101	Camera Port	

6. Cap Detection and Orientation Analysis

Cap detection and Orientation Analysis

Using object detection to detect and analyze orientation of cap. Using for robotic project.

Image from camera → Deep Learning model to detect position and top/bottom/side → Output: Position and kind of cap (top/bottom/side) → Control robot

6. Cap Detection and Orientation Analysis

7. Steel Defect Detection and Segmentation

Requirements
- Detect and classify defect on steel sheet. - Segmentation defect area

Original

Expect result (Labeled)

DL result
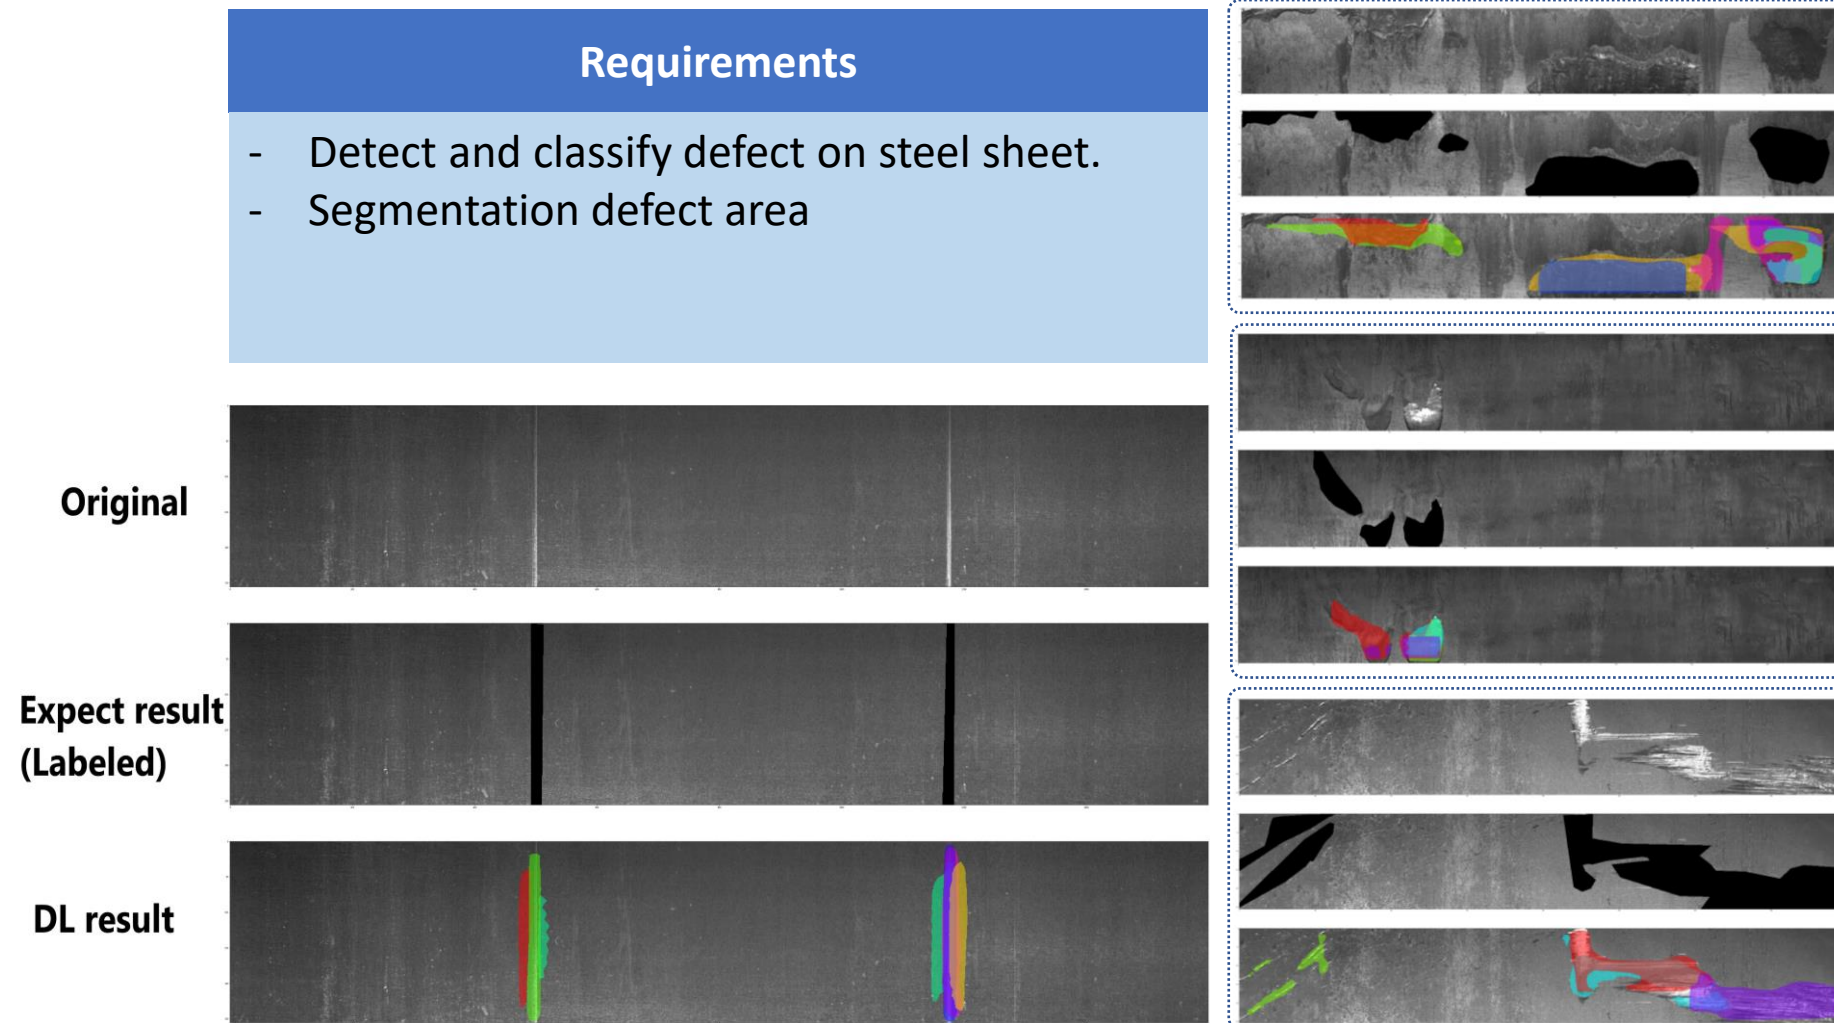

8. Coin Classification

What is this for?

Double head-size of Australian coin can have thousand dollars value.

How it works?

A system with camera on top and bottom which capture 2 size of coin. Then using image classification to classify kind of size: *head, tail or not-any (not a coin)*

Classification model

A pretrain classification model to classify kind of coin (head/tail) and deploy into Raspberry Pi 4.

Camera

coin   coin

Camera

TAIL/TAIL

HEAD/HEAD

HEAD/TAIL
